Species: *Moringa oleifera*

Moringa, often called the "miracle tree", is a fast-growing, drought-resistant tree, native to the southern foothills of the Himalayas in northwestern India, and widely cultivated in tropical and subtropical areas. Its uses are many: from the seed pods and leaves used as food, to its water purification properties, the moringa leaves are also used in many traditional medicines. Moringa is possibly the most nutritious plant on the planet. Its leaves are a source of multiple vitamins, Calcium, protein and other essential nutrients. The fact this species grows very well in very arid conditions makes it an amazing solution for countries facing malnutrition crises.

Tree(s) planted in *Project Bore, Kenya*

Lots of recent research indicates clearly that we need to conserve our vulnerable tropical forests if we are to have any hope of stopping complete and irreversible Climate Breakdown. Since 2007, this unique project has been working closely with ordinary Kenyan subsistence farmers to find ways to help them grow new food and timber crops that improve bio-diversity and reduce the stress on their threatened and critically important tropical forest.
